Mechanical Ventilation provides students and clinicians concerned with the care of patients requiring mechanical ventilatory support a

comprehensive guide to the evaluation of the critically ill patient, assessment of respiratory failure, indications for mechanical ventilation, initiation of mechanical ventilatory support, patient stabilization, monitoring and ventilator discontinuance. The text begins with an introduction to critical respiratory care followed by a review of respiratory failure to include assessment of oxygenation, ventilation and acid-base status. A chapter is provided which reviews principles of mechanical ventilation and commonly used ventilators and related equipment. Indications for mechanical ventilation are next discussed to include invasive and non-invasive ventilation. Ventilator commitment is then described to include establishment of the airway,

choice of ventilator, mode of ventilation, and initial ventilator settings. Patient stabilization is then discussed

The latest edition of this popular book covers the “ how-to ” of respiratory care of newborns. Chapters from the previous edition have been updated to reflect advances in both equipment and practice, while newer chapters reflect the evolving worldwide approaches to neonatal respiratory failure, such as sustained inflation, optimization of lung volume, and the use of volumetric capnography, aerosol therapy, and management of chylothorax. New additions to the book also include chapters on assessment of large data bases, implementation of quality

improvement programs in neonatal respiratory care, chronic ventilation of the baby with non-respiratory failure. The text also features case studies for self-review and is illustrated with high quality radiographic images, figures, tables, and algorithms. Written and edited by international experts, the Manual of Neonatal Respiratory Care, Fourth Edition is a thorough update and remains a convenient source of practical information on respiratory physiology, exam techniques, tips for performing procedures, radiography, ventilation, pain management, transport, and discharge planning.

The ESC Textbook of Intensive and Acute Cardiovascular Care is the official textbook of the Acute Cardiovascular Care Association (ACCA) of the ESC. This new updated edition continues to comprehensively approach all the different issues relating to intensive and acute cardiovascular care. The textbook is addressed to all those involved in intensive and acute cardiac care, from cardiologists to emergency physicians and healthcare professionals. The chapters cover the various acute cardiovascular diseases that need high quality intensive treatment, but also organisational issues, cooperation among professionals, and interaction with other specialities in medicine. The

largest section of the textbook is devoted to non-cardiac disease which could acutely involve the cardiovascular system. Other noteworthy chapters are on ethical issues - which are so important in acute cardiac care, such as patient safety, donor organ management and palliative care. A unique characteristic of the textbook is the presence of a whole section devoted to biomarkers, which underline the growing importance of laboratory medicine in the field of intensive and acute cardiac care. A particular asset of the textbook is the digital version available on Oxford Medicine Online, which has additional online features including an extra chapter on lung ultrasound and many more images and videos, as well as a full list of references from all chapters. The

online version is updated by the same authors on a yearly basis and is available with the print version and separately on a subscription basis, allowing easy access to content in digital and mobile optimised format. The textbook aligns directly with the core training curriculum for ACCA.
