Rabies is the most current and comprehensive account of one of the oldest diseases known that remains a significant public health threat despite the efforts of many who have endeavored to control it in wildlife and domestic animals. During the past five years since publication of the first edition there have been new developments in many areas on the rabies landscape. This edition takes on a more global perspective with many new authors offering fresh outlooks on each topic. Clinical features of rabies in humans and animals are discussed as well as basic science aspects, molecular biology, pathology, and pathogenesis of this disease. Current methods used in defining geographic origins and animal species infected in wildlife are presented, along with diagnostic methods for identifying the strain of virus based on its genomic sequence and antigenic structure. This multidisciplinary account is essential for clinicians as well as public health advisors, epidemiologists, wildlife biologists, and research scientists wanting to know more about the virus and the disease it causes. • Offers a unique global perspective on rabies where dog rabies is responsible for killing more people than yellow fever, dengue fever, or Japanese encephalitis • More than 7 million people are potentially exposed to the virus annually and about 50,000 people, half of them children, die of rabies each year • New edition includes greatly expanded coverage of bat rabies which is now the most prominent source of human rabies in the New World and Western Europe, where dog rabies has been controlled • Recent successes of controlling wildlife rabies with an emphasis on prevention is discussed • Approximately 40% updated material incorporates recent knowledge on new approaches to therapy of human rabies as well as issues involving organ and tissue transplantation • Includes an increase in illustrations to more accurately represent this diseases' unique horror

This textbook provides a unique support in gaining essential knowledge on the immune response, its diagnosis and its modification by drugs and chemicals. The first section of the book, covering a basic introduction to immunology and its relevance for human disease, has been updated to accommodate new immunological concepts. The second section on immunodiagnostics has been further expanded to describe widely used molecular techniques and is followed by a systematic coverage of drugs affecting the immune system, revised to cover recent developments. The book concludes with a chapter on immunotoxicology. This third edition continues the unique format dealing with four related topics in a single volume, obviating the need to refer to several different textbooks. New aids to the reader include a two-column format, glossaries of technical terms and appendix reference tables. The emphasis on illustrations is maintained from the first edition.

The vaccines most urgently needed are those against poverty-related diseases such as tuberculosis, malaria and HIV. However, there is a considerable gap between the development of a vaccine and the implementation as a useful measure for disease control. Major obstacles need to be overcome even after successful completion of the preclinical stage. This book provides an important link between vaccine development and application under the particular conditions in developing countries. The editors, S.H.E. Kaufmann and P.H. Lambert - one from the field of basic research and the other an expert on the side of applied vaccinology - have gathered contributions from specialists of both fields in an attempt to create a source of information that has thus far not been available.
